Inspect

Note : All air compressors have a small amount of oil carryover which lubricates the piston rings and moving parts. When this oil is exposed to normal air compressor operating temperatures over a period of time, it will form varnish or carbon deposits. If the following inspections are not performed, the air compressor piston rings will be affected by high operating temperatures and pressures, and will not seal correctly.

Complete the air compressor inspection per the maintenance schedule. Refer to Procedure 102-002 in Section 2.
