General Information

The exhaust system consists of the exhaust manifold and exhaust piping.

Rail Applications

The QSK19 Rail engine exhaust center section has been changed to accommodate the angle of the exhaust transfer connection. The exhaust transfer connection allows the turbocharger to be extended above and over the rocker covers to maintain a low profile design needed in a railcar application. The exhaust transfer connection has two supporting brackets that mount to the No. 2 and No. 3 rocker lever housings

The two capscrews and spacers for the upper inside capscrew locations on the exhaust center section of the exhaust manifold have been shortened to make it possible to get a wrench on the capscrew heads.

During installation, apply an antiseize compound on the capscrews threads.
