California Aftertreatment Regulation Adherence	

California Aftertreatment Regulation Adherence

Overview

This document provides guidance for repair facilities in California to comply with the “California Catalytic Converter Regulation.” For any vehicle serviced in California, if an aftertreatment component with a core value is being installed, the vehicle identification number (VIN) **must** be permanently marked on the new aftertreatment component.

If the aftertreatment component being removed from the vehicle does **not** already have the VIN marked on the removed component, the VIN **must** also be permanently added to that removed aftertreatment component.

Service Instructions

The new aftertreatment component being installed **must** have the VIN permanently marked using one of the following methods: etching, pen welding, or chemical etching. Ideally, the VIN should remain visible on the aftertreatment component after the component has been installed back on the vehicle.
