Excessive Gear Train Noise/Whine

Excessive Gear Train Noise/Whine

Warranty Statement

The information in this document authorizes specific changes to the repair practice for failures covered under product warranty coverages.

Contents

Product Affected

- ISX (All Versions)
- ISX15 (All Versions)
- QSX15 (All Versions)

Issue

Symptom:

- High pitched whining noise from the engine gear train that changes with engine rpm.

Root Cause:

- Crankshaft gear tooth profiles are out of specification on select crankshaft gears.

Verification

- Crankshaft gear teeth that are out of specification can **not** be visually detected.
- Engines with suspect crankshaft gears were built between May 2015 and January 2016.
- Confirm the crankshaft gear is suspect by looking for the supplier code "AARGP" and "INDIA" stamped on the rear face of the crankshaft gear. See Figure 1 below.
- In some cases, a small mirror may be needed to view the rear face of the crankshaft gear.
- The following audio link below provides an example of an engine with a crankshaft gear with a tooth profile that is out of specification.

(<http://tsb.cumminsvirtualcollege.com/audio/tsb160042.mp3>)

Note : The high pitched whining noise is **not** always noticeable at idle, and can be heard more easily between 1100 rpm and 1500 rpm.

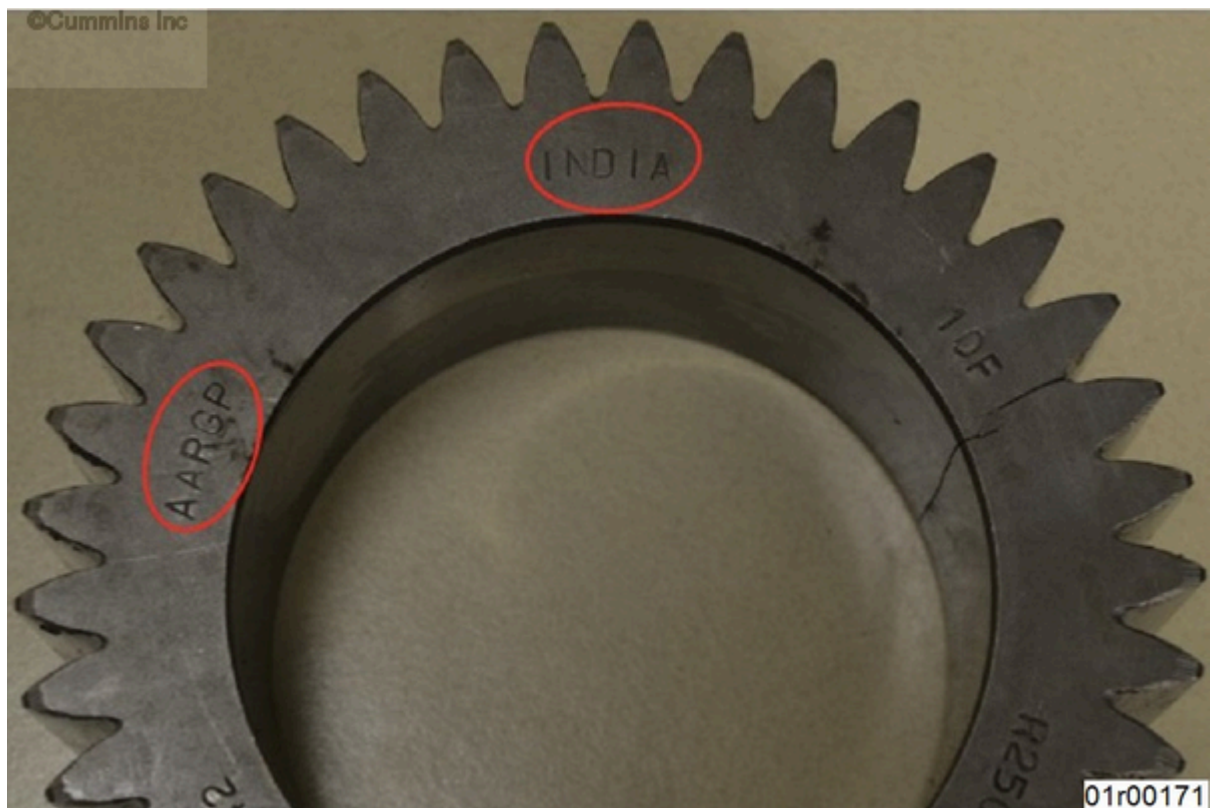

Figure 1, Identification Marks on the Rear Face of Suspect Crankshaft Gear

Resolution

If an engine is found to have excessive gear train noise/whine AND the crankshaft gear matches the criteria for a suspect crankshaft gear:

- Replace the crankshaft gear. See the corresponding Service Manual. Reference Procedure 001-018 in Section 1.
- Confirm that the gear train noise is no longer present prior to performing other published troubleshooting.

Document History

Date	Details
2016-4-25	Module Created
2016-6-1	Corrected "AAPGP" to "AARGP".
