General Information

A special surface treatment is applied to the QSK23 cam follower roller surfaces to maintain adequate lubrication. The cam follower, push tube, and rocker lever are optimized to keep rigidity during injection pressures, to reduce weight, and reduce the possibility of drive system no follow conditions. Cam follower roller pins are assembled using liquid nitrogen. Replacement rollers and pins are **not** available for service. If the roller fails, the entire cam follower roller assembly **must** be replaced. The cam follower rollers are micro-finished and have a complex crown. The rollers **must not** be reground for service.
