General Information

Beginning in January 2013, all Cummins® engines are Organic Acid Technology (OAT)/Extended Life coolant compatible. Coolant filters are now optional.

Most Cummins® engines built prior to January 1, 2013 were manufactured with a coolant filter head. Use of a coolant filter is recommended. After January 1, 2013, coolant filters are **only** standard equipment on Cummins® engines greater than 15 liters in displacement. If desired, an aftermarket engine coolant filter head from Cummins Filtration™ can be easily installed on most engines with displacement less than 15 liters.

Several types of coolant filters are available for use on Cummins® engines. The choice of coolant filter type will depend on choice of coolant formulation and choice of service interval. If coolants capable of an extended service interval are used, an extended service interval coolant filter **must** also be used.

Chemical Filters

Some coolant filters contain additives for Supplemental Coolant Additive (SCA) replenishment. These filters, usually referred to as chemical filters, should **only** be used with conventional and hybrid coolants that require SCA replenishment.

Chemical-Free Filters

OAT coolants do **not** require SCA replenishment, and **must** use chemical-free coolant filters.
