Common Warning Output Relay Driver Circuit

Circuit Description

The engine control module (ECM) checks the common warning output relay driver to make certain it is operating correctly. The ECM uses the common warning output to inform if any customer systems/features are dependent on the ECM for knowledge for noncritical fault with the generator set.

The ECM monitors the voltage (no voltage increase will trip Fault Code 1321) and can be caused by shorts, opens, or a failed common warning output relay driver in the ECM.

Component Location

Refer to the customer/facility/installation/documentation for the location of the common relay warning output.

Shoptalk

The possible failure modes are open circuit, short to ground, and loss of supply voltage inside the ECM.

Refer to Troubleshooting Fault Code t05-1321. (</qs3/pubsys2/xml/en/procedures/01/01-t05-1321.html>)
