Overspeed Shutdown Relay Driver Circuit

Circuit Description

The ECM checks the overspeed shutdown relay driver to sustain correct operation. The ECM uses the overspeed shutdown relay to inform the operator of a noncritical fault. The ECM monitors the voltage, no voltage drop will trip Fault Code 1427, and can be caused by shorts, opens, bad relays, or a failed overspeed shutdown relay driver in the ECM.

Component Location

Refer to the OEM manual for location of the ECM. Refer to the OEM manual for location of the user interface panel and the overspeed shutdown relay.

Shoptalk

The possible failure modes are open circuit, short to ground, burned-out relay, and loss of supply voltage inside the ECM.

Refer to Troubleshooting Fault Code t05-1427 (</qs3/pubsys2/xml/en/procedures/01/01-t05-1427.html>)
