Generator Circuit

Circuit Description

The generator set circuit breaker is the switch for the generator set's connection to the bus. The circuit breaker opens when events have occurred, which forces the generator set to no longer be connected to the bus. The circuit breaker closes when the generator set is to be connected to the bus.

This fault code is used by the engine control module (ECM) to tell the operator that the electronically selected position contact for the utility circuit breaker is **not** correct for the generator application.

Component Location

Refer to Section E for location of the ECM card cage.

Refer to customer/facility/installation documentation for the location of the generator set circuit breaker.

Shoptalk

The possible failure modes are improper calibration/trim and/or setup.

Refer to Troubleshooting Fault Code t05-1455. (</qs3/pubsys2/xml/en/procedures/01/01-t05-1455.html>)
