

Fault Code: 1471

Generator AC Output Current High - Warning

 Printable Version

Overview

Codes	Reason	Effect
Fault Code: 1471 PID(P): SPN: FMI: Lamp: Warning SRT:	AC output current has exceeded the warning threshold for high current.	No action is taken by the ECM.

AC Output Current Circuit

Circuit Description

The generator set produces electric power. This power is in the form of three-phase AC. The engine control module (ECM) monitors the AC output current to make certain it is operating correctly and performance of the generator output current has exceeded 110 percent of rated for at least 60 seconds.

The ECM uses this fault code to tell the operator when the AC output current passes the warning threshold for high current.

Component Location

Reference Section E for location of the voltage regulator and PT/CT module.

Shoptalk

The alternator is beginning to become overloaded. The AC output current has passed the calibrated threshold for a warning level.

Check load-sharing lines for proper connection.

Refer to Troubleshooting Fault Code t05-1471. (</qs3/pubsys2/xml/en/procedures/01/01-t05-1471.html>)
