

Fault Code: 1472

Generator AC Output Current High - Critical

 Printable Version

Overview

Codes	Reason	Effect
Fault Code: 1472 PID(P): SPN: FMI: Lamp: Shutdown SRT:	AC output current has exceeded the shutdown threshold for high current.	Generator set will shut down.

AC Output Current Circuit

Circuit Description

The generator set produces electric power. This power is in the form of three-phase AC. The engine control module (ECM) monitors the AC output current to make certain the generator set is performing and operating correctly. The threshold for a high AC output current condition is that the generator output current has exceeded 100 percent of rated for at least 120 seconds.

The ECM uses this fault code to tell the operator when the AC output current passes the shutdown threshold for high current.

Component Location

Reference Section E for location of the voltage regulator and PT/CT board.

Shoptalk

The alternator is beginning to become overloaded. The AC output current has passed the calibrated threshold for a shutdown level.

Check load-sharing lines for proper connection.

Refer to Troubleshooting Fault Code t05-1472. (</qs3/pubsys2/xml/en/procedures/01/01-t05-1472.html>)
