Fail To Start Relay Driver Circuit

Circuit Description

The engine control module (ECM) checks the fail-to-start relay driver to sustain correct operation. The ECM uses the fail-to-start relay to inform the operator of a noncritical fault. The ECM monitors the voltage, no voltage drop will trip Fault Code 1479, and can be caused by shorts, opens, bad relays, or a failed fail to start relay driver in the ECM.

Component Location

Reference the OEM service manual for location of the ECM. Reference the OEM service manual for location of the user interface panel and the fail to start relay.

Shoptalk

The possible failure modes are open circuit, short to ground, burned-out relay, and loss of supply voltage inside the ECM.

Refer to Troubleshooting Fault Code t05-1479. (</qs3/pubsys2/xml/en/procedures/01/01-t05-1479.html>)
