Electronic Fuel Control

Circuit Description

The engine control module (ECM) checks the electronic fuel control (EFC) driver to make certain it is operating correctly. The ECM uses this fault code to inform the operator that the ECM is no longer driving the EFC.

The electronic fuel control unit is **only** used on hydromechanical fuel systems. This fault code will **not** be active on any other types (electronic full-authority) of fuel systems.

The ECM monitors the voltage (no voltage will trip Fault Code 1486), and can be caused by shorts, opens, a failed voltage regulator, or a failed voltage regulator driver in the ECM.

Component Location

Reference Section E for location of the electronic fuel control.

Shoptalk

The possible failure modes are short circuit, open circuit, and loss of supply voltage inside the ECM.

Refer to Troubleshooting Fault Code t05-1486. (</qs3/pubsys2/xml/en/procedures/01/01-t05-1486.html>)
