Classifying Cummins Engine (MR, HD, HHP) and Applications

Classifying Cummins Engine (MR, HD, HHP) and Applications

Overview

Cummins Inc. engines are traditionally classified into three categories based on engine displacement:

- Mid-Range (MR): Displacement less than 10 liters
- Heavy Duty (HD): Displacement between 10 to 16 liters
- High Horsepower (HHP): Displacement greater than or equal to 17 to 95 liters

Note : Some engine programs with displacement less than 17 to 95 liters may still be classified as HHP due to performance characteristics or application-specific attributes.

Importance of Classification

Accurate engine classification is critical for determining applicable warranty coverage, particularly in the following areas:

- Marine applications
- New parts coverage
- ReCon parts coverage

Determining Engine Classification

Engine classification is derived from the Marketing Configuration found on the engine dataplate. This configuration provides key identifiers used to determine both classification and application.

Configuration Definitions

- Technical Configuration: Describes the engine build and intended application at the time of manufacture.
- Marketing Configuration: Describes the engine build and application as sold. This configuration is used for warranty and application classification.
- Both configurations are 11-digit alphanumeric codes.

Key Digits in Marketing Configuration

- Digits 2 and 3: Represent the Engine Family. Use this to determine classification (MR, HD, HHP).
- Digits 8 and 9: Represent the Marketing Application Code. Use this in conjunction with the Engine Family to determine warranty coverage, including base and emissions coverage.

Reference Tables

- Engine Family Classification Table: Maps engine families to MR, HD, or HHP categories.
- Marketing Application Code Table: Defines application codes and their meanings.
- For detailed definitions of Marketing Application Codes, refer to the Warranty Administration Manual (4021290), Section 111-509-007.

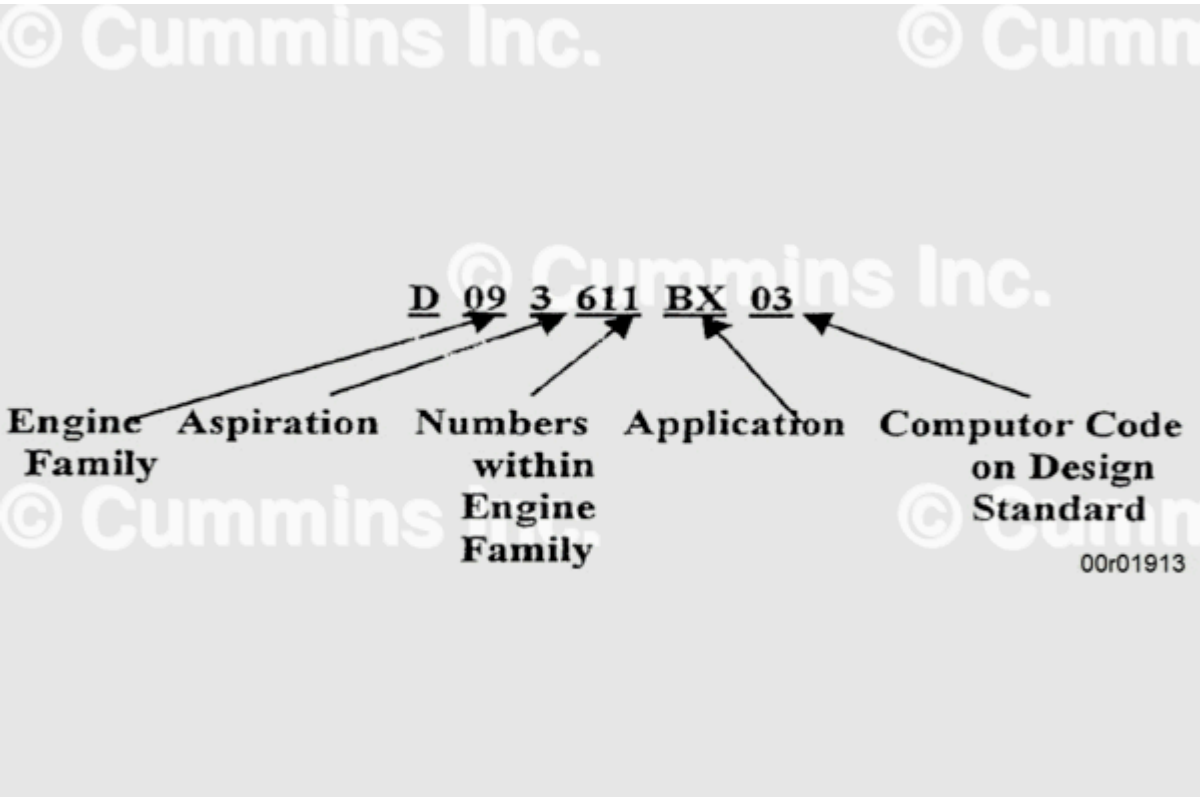

Figure 1, Technical/Marketing Configuration Example.

Summary

- Use Table 1 to determine product classification.
- Use Table 2 to determine application codes.
